The Obligatory Marshall Quotation

When an industry has thus chosen a locality for itself, it is likely to stay there long: so great are the advantages which people following the same skilled trade get from near neighbourhood to one another. The mysteries of the trade become no mysteries; but are as it were in the air, and children learn many of them unconsciously. Good work is rightly appreciated, inventions and improvements in machinery, in processes and the general organization of the business have their merits promptly discussed: if one man starts a new idea, it is taken up by others and combined with suggestions of their own; and thus it becomes the source of further new ideas.

Alfred Marshall. 1890. Principles of Economics. London: Macmillan. Book IV, Ch. X, § 3: The advantages of localized industries; hereditary skill.

Boston: Commerce to Manufacturing

- Founded in 1630 as Winthrop's "City upon a Hill"
 - A religious community, not a production-oriented colony
 - Human capital: Boston Latin (1635), Harvard College (1636)
- Exports foodstuff and wood to other colonies
 - New England had cheaper land than the South and the Caribbean
- Overtaken by New York and Philadelphia after 1740
- Maritime reinvention, 1820-1850
 - New York provides the port
 - Boston provides the ships, sailors, merchants
 - Sail-specific human capital declines after 1840
- Manufacturing reinvention, 1860-1920
 - China-trade capital and immigrant Irish workers
 - Switch from water to steam power
 - New England's railroad hub

Boston: Manufacturing to Services

- Decades of population decline
 - Relative to the U.S., 1920-1950
 - 2 Absolute, 1950-1980
- Nation-wide trends working against Boston
 - Manufacturing left cities
 - Car cities replaced higher-density old cities
 - People fled cold places
 - The rich fled local redistribution
- Nadir in the 1970s
 - ▶ 75% of homes were worth less than construction costs
- Skill-driven reinvention
 - Higher education
 - Professional, scientific, and technical services
 - Finance

Three Kinds of Externalities

- Marshall-Arrow-Romer
 Local knowledge spillovers between firms in the same industry
 ⇒ Specialization and concentration promote growth
 - Local monopoly helps growth by internalizing externalities

2 Porter

Innovation in competitive industry clusters with many small firms \Rightarrow Specialization and fragmentation promote city growth

Local competition requires firms to innovate or die

Jacobs

Local knowledge transfers across industries

- \Rightarrow Diversification and fragmentation promote city growth
 - Weitzman's (1998) "recombinant growth"

Extremes of City-Industry Growth

City-Industry	Growth Nondiversity		Competition	Concentration			
	Five Fastest-Growing City-Industries*						
Albuquerque							
Business services	3.325	.217	1.500	1.090			
San Jose, Calif.

Gadsden, Ala.							
Textile mills	-4.714	.406	.185	4.876			

* Growth is log(employment in 1987/employment in 1956). Nondiversity is city's other top five industries' share of 1956 total city employment. Competition is establishments per employee relative to establishments per employee in the U.S. industry. Concentration is the city-industry's share of city employment relative to U.S. industry's share of U.S. employment in 1956.

Separation of Innovation and Mass Production

Duranton and Puga's (2001) assumptions

- Localization economies
 - Input suppliers are shared by local producers using the same process
 - Static advantages to urban specialization
- Experimentation in process innovation
 - Start-ups need to try out alternative processes available locally
 - Dynamic advantages to urban diversity
- Ongestion
 - Monocentric cities with scarce land and commuting costs
 - Endogenous limit to city size

Steady state with two types of cities

- Diversified cities where innovation takes place
- Specialized cities where mass production takes place

- 31

・ロン ・四と ・ヨン ・ヨン

Non-Tradable Intermediates

- *m* intermediate sectors employ sector-specific human capital
- Standard model of input-sharing at the sector level
 - The output of the sector is a CES aggregate of differentiated varieties
 - Intermediates cannot be traded across cities
 - Monopolistic competition, increasing returns to scale, free entry
- Sector j in city i employs l'_i workers with sector-specific human capital
 - Employment l_i^j at wages w_i^j
 - Workers can move across cities but not across sectors
- Price index for intermediate sector i in city i

$$Q_i^j = w_i^j \left(l_i^j
ight)^{-\epsilon}$$

You can always normalize units so that constants disappear

Tradable Final Goods

- Final goods are tradable at no cost
- Two types: prototypes and mass-produced goods
 - Cobb-Douglas utility with budget share $\mu \in (0,1)$ for prototypes
 - CES aggregation of varieties within each type
 - Monopolistic competition
- *m* technologies: using intermediates from a single sector *j*
 - The variety produced is independent of the technology used

• Cost function for firm h producing $\tilde{x}_{i}^{j}(h)$ prototypes with technology j

$$\tilde{C}_{i}^{j}(h) = Q_{i}^{j}\tilde{x}_{i}^{j}(h) = w_{i}^{j}\left(I_{i}^{j}\right)^{-\varepsilon}\tilde{x}_{i}^{j}(h)$$

• Cost advantages of mass production

$$C_{i}^{j}(h) = \rho Q_{i}^{j} x_{i}^{j}(h) = \rho w_{i}^{j} \left(I_{i}^{j} \right)^{-\varepsilon} x_{i}^{j}(h) \text{ with } \rho \in (0,1)$$

- 3

- 4 同 6 4 日 6 4 日 6

The Product Life Cycle

Creating a final-good firms requires a start-up cost

- F units of the composite final good
- Financed by perfectly competitive, frictionless capital markets
- A new firm produces prototypes
 - It can try out all m technologies, one at a time
 - By trial and error it can identify its idiosyncratic ideal technology
 - It could also stop searching without learning its ideal technology
- **③** A firm that has learnt its ideal technology can start mass production
 - Relocating causes a firm to lose one period's output
 - ullet Firms die at a homogeneous exogenous rate δ
 - No storage technology, zero rate of time preference

3

A B < A B <</p>

Congestion and Labor Supply

- There is a continuum L of infinitely lived workers
- Fraction 1/m of workers have skill j for all j = 1, ..., m
- L_i^j workers with skill j live in city i
- Congestion costs in each city reduce labor supply to

$$U_i^j = L_i^j \left(1 - \tau \sum_{j=1}^m L_i^j\right)$$

- Linear monocentric city with linear commuting costs
 - Direct assumption with partial microfoundation
 - If a city hosted many sectors with different wages ...

City-Industry Equilibrium

• Firms in a given city-industry are all identical

• Prices
$$\tilde{p}_{i}^{j} = Q_{i}^{j}\sigma/(\sigma-1)$$
 and $p_{i}^{j} = \rho Q_{i}^{j}\sigma/(\sigma-1)$

- Output \tilde{x}_i^J and x_i^J
- Derived demand for labor $(l_i^j)^{-\varepsilon} \tilde{x}_i^j$ and $\rho (l_i^j)^{-\varepsilon} x_i^j$
- Labor-market clearing

$$ilde{ extsf{n}}_{i}^{j} ilde{ extsf{x}}_{i}^{j}+
ho extsf{ extsf{n}}_{i}^{j} extsf{ extsf{x}}_{i}^{j}=\left(extsf{ extsf{ extsf{l}}}_{i}^{j}
ight)^{1+arepsilon}$$

• Since $p_i^j = \rho \tilde{p}_i^j$, output per worker in city *i* with technology *j* is

$$\frac{\tilde{n}_{i}^{j}\tilde{x}_{i}^{j}+\rho n_{i}^{j}x_{i}^{j}}{L_{i}^{j}}=\left(L_{i}^{j}\right)^{\varepsilon}\left(1-\tau\sum_{j=1}^{m}L_{i}^{j}\right)^{1+\varepsilon}$$

(日) (四) (王) (王) (王)

Optimal City Size

• Regardless of specialization, cities have optimal size

$$L^* = \arg \max_{L_i} \left\{ L_i^{\varepsilon} \left(1 - \tau L_i \right)^{1+\varepsilon}
ight\} = rac{arepsilon}{\left(1 + 2arepsilon
ight) au}$$

- Increasing in localization economies: $\partial L^* / \partial \epsilon > 0$
- Decreasing with congestion costs: $\partial L^* / \partial \tau < 0$
- There are no coordination failures with respect to city creation
 - E.g., perfectly competitive profit-maximizing developers
- The Henry George Theorem applies
 - All cities have the optimal size L*
 - Each worker earns $w_i^j (1 \tau L^*)$ net of house prices and transfers

- 31

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Two Types of Cities

Specialized cities

- All workers have the same skill j
- All firms use the same technology j
- Perfectly diversified cities
 - Fraction 1/m of workers have skill j for all j = 1, ..., m
 - Fraction 1/m of firms use technology j for all j = 1, ..., m
 - Other equilibrium configurations are assumed away
 - Workers know only if a city is perfectly diversified
 - > Otherwise, they believe it is fully specialized in its dominant industry
 - Self-fulfilling beliefs

3

A B F A B F

Nursery Configuration

- N_D diversified and mN_S specialized cities coexist
- N_S specialized cities host each skill j = 1, ..., m
- Each new firm locates in a specialized city and produces prototypes using a different technology each period
- As soon as it learns its ideal technology, it relocates to a city specialized in that technology and starts mass production

Existence of a steady-state nursery configuration depends on

- The relative production costs in the two types of cities
- Interview of the prototype to mass producers
- 3 The expected duration of each stage of the life cycle

- 31

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Relative Costs

• Unit production costs for final goods in specialized cities

$$Q_{S}=\left[L^{*}\left(1- au L^{*}
ight)
ight]^{-arepsilon}$$
ws

• Unit production costs for final goods in diversified cities

$$Q_D = \left[\frac{L^*}{m}\left(1 - \tau L^*\right)\right]^{-\varepsilon} w_D$$

Spatial equilibrium

$$w_S = w_D \Rightarrow \frac{Q_D}{Q_S} = m^{\epsilon}$$

Relative profitability of specialized cities

$$\frac{\tilde{\pi}_S}{\tilde{\pi}_D} = \frac{\pi_S}{\pi_D} = \left(\frac{Q_D}{Q_S}\right)^{\sigma-1} = m^{\varepsilon(\sigma-1)}$$

Relative Profits

• Relative profitability of mass production

$$\frac{\pi_S}{\tilde{\pi}_D} = \frac{1-\mu}{\mu} \left(\frac{P}{\rho Q_S} \frac{Q_D}{\tilde{P}} \right)^{\sigma-1} = \frac{1-\mu}{\mu} \frac{N_D \tilde{n}_D}{N_S n_S}$$

- \tilde{n}_D prototype producers using each technology in each nursery city
- n_S mass producers in each specialized city
- The equilibrium aggregate ratio of prototype to mass producers

$$\Omega \equiv \frac{N_D \tilde{n}_D}{N_S n_S}$$

reflects how unlikely a firm is to find the ideal technology

- Less likely if there is more uncertainty: $\partial \Omega / \partial m > 0$
- Less likely if there is more exogenous failure: $\partial\Omega/\partial\delta>0$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Leaving the Nursery

- Firms are born at a constant rate *n*
- A firm in the nursery find its ideal technology at age t with probability

$$rac{(1-\delta)^t}{m}$$
 for $1\leq t\leq m-2$ or $rac{2\,(1-\delta)^{m-1}}{m}$ for $t=m-1$

- A fraction δ of relocating firms die in transit
- Constant number of firms n₅ in each specialized city

$$\delta m N_{S} n_{S} = (1 - \delta) \left[\sum_{t=1}^{m-2} (1 - \delta)^{t} + 2 (1 - \delta)^{m-1} \right] \frac{\dot{n}}{m}$$

Constant aggregate number of firms

$$\delta\left(N_D m \tilde{n}_D + \frac{\delta m N_S n_S}{1 - \delta} + m N_S n_S\right) = \dot{n}$$

 \Rightarrow These two conditions yield an explicit solution for Ω

Expected Production Periods

- Nursery strategy

 - 2 Expected number of periods in mass production Δ
- Deviation: produce each prototype in a different specialized city
 - **1** Expected number of periods producing prototypes $ilde{\Delta}_{OSC}$
 - 2) Expected number of periods in mass production Δ_{OSC}
- All these durations have explicit but very tedious solutions

Existence of the Nursery Steady State I

• Firms relocate to a specialized city after finding their ideal technology

$$(1-\delta)\frac{\pi_S}{\delta} \ge \frac{\pi_D}{\delta}$$

Irims switch to mass production after finding their ideal technology

$$\frac{\tilde{\pi}_{S}}{\pi_{S}} = \frac{\tilde{\pi}_{D}}{\pi_{D}} \le 1$$

Similar Firms do not abandon diversified cities after m - 2 trials

$$(1-\delta)\left[\tilde{\pi}_{\mathcal{S}} + \frac{1-\delta + (1-\delta)^2}{2}\frac{\pi_{\mathcal{S}}}{\delta}\right] \leq \tilde{\pi}_{\mathcal{D}} + (1-\delta)^2\frac{\pi_{\mathcal{S}}}{\delta}$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Existence of the Nursery Steady State II

Firms do not settle on a random specialized city

$$\frac{\tilde{\pi}_{S}}{\delta} + \frac{1-\delta}{m} \frac{\pi_{S} - \tilde{\pi}_{S}}{\delta} \le \tilde{\Delta} \tilde{\pi}_{D} + \Delta \pi_{S}$$

Firms do not relocate across specialized cities to produce prototypes

$$\tilde{\Delta}_{OSC}\tilde{\pi}_{S} + \Delta_{OSC}\pi_{S} \leq \tilde{\Delta}\tilde{\pi}_{D} + \Delta\pi_{S}$$

• Other possible deviations do not create binding conditions

Existence in the Parameter Space

Nurserv Cities

Stability and Uniqueness

Stability: The nursery steady state is stable with respect to small perturbations in the spatial distribution of workers

• Competitive developers create both types of city with optimal size L^*

Uniqueness: Whenever the nursery steady state exists it is unique

- All mass producers are in specialized cities (1)
- 2 The nursery strategy maximizes the duration of mass production (4)
- **3** If some firms deviate, Ω increases to Ω'
- $\Omega' > \Omega$ slackens the conditions for optimality of the nursery strategy
- \Rightarrow If the nursery strategy is a best response when all firms follow it, a fortiori it is a best response when some firms are deviating

3

* The SIC is the standard industrial classification used in the U.S. Small Business Administration's Innovation Citation Data Base.

^b The total number of innovations recorded in the four-digit industry is listed in parentheses.

イロト 不得下 イヨト イヨト 二日

The Geography of Innovation and Production

- Innovative activity tends to cluster spatially
 - Geographic concentration of innovation varies by industry
 - 2 Does not coincide with geographic concentration of production
- Traditional arguments for concentration of production
 - Dependency on natural resources
 - Low transportation costs
 - Large economies of scales
- Clustering of innovation when new knowledge is particularly important
 - Industry expenditure on R&D relative to sales
 - Share of skilled workers in industry employment
 - University research relevant to the industry
- \Rightarrow Indirect evidence of knowledge spillovers

Three-Fold Interest in Human Capital Externalities

Labor and education policy

- Social returns to skill > private returns to skill
- Education as a public good
- Rationale for vast government intervention
- Endogenous growth theory
 - ► Lucas (1988) allows a country's average human capital to increase TFP
 - ► Constant returns for the economy, decreasing returns for each firm
 - Implied elasticity of output to aggregate human capital $\simeq 0.4$

Orban economics

- Human capital predicts city growth
- Human capital predicts housing values
- Human capital predicts wage residuals

Basic Intuition

Suppose the true relation between wages and human capital is

$$\log w_{ic} = \alpha + \beta \log h_{ic} + \gamma \log \bar{h}_c + \varepsilon_{ic}$$

Omitted-variable bias

$$rac{\partial \log w_{ic}}{\partial h_{ic}} = eta + \gamma rac{\textit{Cov} (h_{ic}, ar{h}_c)}{\textit{Var} (h_{ic})}$$

Ontrolling for city fixed effects

$$\left.\frac{\partial \log w_{ic}}{\partial h_{ic}}\right|_{c} = \beta$$

Across cities

$$rac{\partial \log ar{w}_c}{\partial ar{h}_c} = eta + \gamma$$

3

Basic Facts

- Lucas (1988) proposed estimating skill externalities with city data
- Rauch (1993) is the seminal Rosen-Roback test
- \bullet One more year of average education yields a 3.1% TFP increase
 - ▶ Reduced to 2.8% if we subtract one year of average experience
- The social return to education is roughly 1.7 times the private return
- Random effects but not clustering
- A single price regression for owners and tenants
- Overage human capital is treated as an exogenous city characteristic
- The Rosen-Roback model is derived with homogeneous agents
 - > We know the theory does not properly work with heterogeneous agents
 - We have not yet figured out exactly how to do it right

3

Endogeneity

Omitted variables

- Skill-complementary city characteristics
- Rauch (1993) uses a few controls
 - ★ Regional dummies
 - ★ Cultural amenities
 - ★ Climate and coastal location
 - ★ Federal R&D funding per capita and presence of major universities
- How can we add all the right controls with the right functional forms?

Self selection

- Sorting by unobserved human capital
- Correlation between observed and unobserved skill
 - \star Endogenous educational choices

Spillovers

Compulsory Schooling Laws

Acemoglu and Angrist's (2000) identification strategy

- Compulsory schooling in an individual's state of birth when he was 14
 - Or state of residence out of concern for migration-inducing shocks
- Instrument for current average schooling in the state
 - Around 66% of agents live in their state of birth
 - Plausibly exogenous to other state conditions 30 years later
- Instrument for individual schooling
 - Analogous to Angrist and Krueger's (1991) quarter of birth
 - Biased by correlation with \bar{h} in the presence of externalities
 - Appropriate use of one instrument for \bar{h} and the other for h
 - Impact on middle- and high-school completion

- 4 目 ト - 4 日 ト - 4 日 ト

Ν	609,852	626,511	729,695	16,659	72,344	161,029	376,479	103,184

Notes: Standard errors corrected for state-year clustering are shown in parentheses. The data are from the Census IPUMS for 1950 through 1990, with the sample restricted to white males aged 40-49 in the Census year. All regressions contain Census-year, year-of-birth, and state-of-birth main effects.

3

Child Labor Laws and Individual Schooling

The figure shows the difference in the probability of schooling greater than or equal to the grade level on the X-axis. The reference group is 6 or fewer years of required schooling.

Lack of Evidence for Human Capital Spillovers

- State fixed effects halve the OLS estimates
 - Suggestive of omitted state characteristics
 - Also persistence of human capital in a state
- Individual IV with compulsory schooling or quarter of birth
 - The difference is positive as predicted
 - It is small and statistically insignificant
- 2SLS estimates are always insignificant
 - ► The confidence intervals do not rule out a small spillover: 1-3%
 - They rule out the OLS estimates
- Is the state the right geographic scope for externalities?
 - Theory more often considers metropolitan areas
- Do we expect spillovers from edging up minimum education?
 - Theory more often suggests trickling down from the top

Colleges and Higher Education Spillovers

Moretti's (2004) identification strategy

- Longitudinal data to control for self-selection
 - City-individual fixed effects
 - Estimate of the impact on residents of time variation in average skill
 - Returns to unobserved ability may vary by city but not over time
- Ontrols for estimated city-specific labor demand shocks
 - Katz and Murphy (1992) instrument based on industry mix
- Instruments for the share of college graduates in a city
 - Nation-wide trends for the city's lagged age-gender mix
 - Presence of a land-grant college (federal program, 1862-1890) 2

Strong Evidence of Human Capital Spillovers

 $\bullet\,$ A 1% increase in a city's college share increases wages by about 1%

- ▶ A 1 year increase in average schooling increases wages by 25%
- Extrapolating to an increase far larger than any in the sample
- Not immediate evidence of spillovers
 - Imperfect substitutability of workers with different skills
 - A greater share of college graduates raises wages for the unskilled
- Cross-section evidence of both spillovers and factor-abundance effects
 - Wages of college graduates increase with their share
 - ② The wage increase may be larger for less educated workers
 - ★ Using one instrument, but not the other

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Notes: Each entry is a separate regression. Years effects are included in all models. Dependent variables are education-city-time specific intercepts in a regression of log wages on sex, race, Hispanic origin, US citizenship and a quadratic term in potential experience. Entries are the coefficients on the percentage college graduates. Instrument in columns 6 and 8 is land-grant college. Standard errors in parentheses.

Giacomo Ponzetto (CREI)

13-14 February 2012 48 / 73

Skill Upgrading

- Skill levels take integer values
- Wages are linear in skill
 - Linear production technology for globally tradable goods
- People become skilled by interacting with skilled people
- Interactions occur among randomly drawn members of the population
- If a person with skill j interacts with someone with skill j' > j, her own skill increases to j + 1 with probability c
 - The more skilled person gets nothing from the encounter
- The frequency of meetings $D\left(N
 ight)$ increases with density: $D'\left(N
 ight)>0$
 - Reduced-form assumption driving agglomeration economies

Population Dynamics

- Population or density N is assumed to be stationary
- Agents live in the same city for all their life
 - Prohibitive moving costs
- The cost of living in the city reflects expected lifetime earnings
- ullet All agents have a constant survival rate of δ per period
 - \blacktriangleright Probability $\delta^{1/D}$ of surviving from a meeting to the next
- Dying agents are replaced by an inflow of agents with zero skill

Binary Skill

- Two skill levels with wages w_0 and w_1
- Fraction $\pi_1\left(t
 ight)$ of the population has skill 1 at time t
- Transition equation

$$\pi_{1}\left(t+\frac{1}{D}\right)=\delta^{\frac{1}{D}}\pi_{1}\left(t\right)+\delta^{\frac{1}{D}}c\left[1-\pi_{1}\left(t\right)\right]\pi_{1}\left(t\right)$$

Agents who already skill 1 and survived
Agents who upgraded from skill 0 and also survived

• Steady state

$$\pi_1 = 1 - rac{\delta^{-rac{1}{D}} - 1}{c}$$
 for $\delta^{-rac{1}{D}} < 1 + c$

- Average skill increases in the imitation rate: $\partial \pi_1 / \partial c > 0$
- Average skill increases in density: $\partial \pi_1 / \partial D > 0$
- Average skill increases in longevity: $\partial \pi_1 / \partial \delta > 0$

Spatial Equilibrium

- Monocentric linear city
- Everyone consumes one unit of land
- The cost of commuting is kd at distance d from the center
- The opportunity cost of land is zero
- The outside opportunity is w₀ forever, without commuting costs
- Rent and commuting costs sum up to kN/2 for everyone
- Spatial equilibrium in steady state

$$\sum_{t=0}^{\infty} (\beta \delta)^{t} \left\{ w_{0} (1 - c\pi_{1})^{t} + w_{1} \left[1 - (1 - c\pi_{1})^{t} \right] - \frac{kN}{2} \right\} = \frac{w_{0}}{1 - \beta \delta}$$

$$\frac{\beta\delta c\pi_1}{1-\beta\delta\left(1-c\pi_1\right)}\left(w_1-w_0\right)=\frac{kN}{2}$$

Learning in Cities

City Size

Spatial equilibrium

$$\frac{\beta\delta\left(1+c-\delta^{-\frac{1}{D}}\right)}{1+\beta\delta c-\beta\delta^{1-\frac{1}{D}}}\left(w_{1}-w_{0}\right)=\frac{kN}{2}$$

Stable (in the usual heuristic sense) if and only if

$$\frac{-\log\delta\left(1-\beta\delta\right)\beta\delta^{1-\frac{1}{D}}}{\left(1+\beta\delta c-\beta\delta^{1-\frac{1}{D}}\right)^{2}}\left(w_{1}-w_{0}\right)\frac{D'}{D^{2}}<\frac{k}{2}$$

- Under the stability condition
 - City size increases in the skill premium: $\partial N / \partial (w_1 w_0) > 0$
 - City size decreases with commuting costs: $\partial N/\partial k < 0$
 - City size increases in the imitation rate: $\partial N/\partial c > 0$
 - City size increases in patience: $\partial N/\partial \beta > 0$
 - City size increases in longevity: $\partial N/\partial \delta > 0$

Multiple Skill Levels

- Fraction $\pi_{j}(t)$ of the population has skill j at time t
- Fraction of the population with skill of at least *j* at time *t*

$$\Pi_{j}\left(t
ight)=\sum_{i=j}^{J}\pi_{i}\left(t
ight)$$

- Let J be the maximum skill level in the city
- Transition equation for all j = 1, ..., J

$$\Pi_{j}\left(t+\frac{1}{D}\right)=\delta^{\frac{1}{D}}\Pi_{j}\left(t\right)+\delta^{\frac{1}{D}}c\pi_{j-1}\left(t\right)\Pi_{j}\left(t\right)$$

• Steady state for $\delta^{-\frac{1}{D}} < 1 + c$

$$\pi_j = rac{\delta^{-rac{1}{D}}-1}{c} \equiv ar{\pi} ext{ for } j=0,...,J-1$$

3

Skill Distribution

• Steady state population share with skill of at least $j \leq J$

$$\Pi_j = 1 - \bar{\pi} j$$

- Steady state population share with maximum skill: $\pi_J = 1 ar{\pi} J$
- Maximum skill level the city can support

$$J = \max\left\{j \in \mathbb{N}: j < rac{1}{ar{\pi}}
ight\}$$

Average skill level

$$\mathbb{E}j = \left(1 - \bar{\pi}\frac{1+J}{2}\right)J$$

• $\Pi_j, J, \mathbb{E}j$ and Var(j) are all

- Increasing in the imitation rate: $\partial \bar{\pi} / \partial c < 0$
- Increasing in density: $\partial \bar{\pi} / \partial D < 0$
- Increasing in longevity: $\partial \bar{\pi} / \partial \delta < 0$

(日) (同) (三) (三)

Evolution of Individual Skill

• An agent with skill j < J upgrades to j + 1 with probability

 $c\left[1-\left(j+1
ight)ar{\pi}
ight]$

• This also applies to j = J if we get rid of the integer constraint:

$$\bar{\pi}^{-1} \in \mathbb{N} \Rightarrow J = \bar{\pi}^{-1} - 1$$

• Then the expectation of skill evolves as

$$\mathbb{E}\left[j\left(t+D^{-1}\right)|j\left(t\right)\right]=c\left(1-\bar{\pi}\right)+\left(1-c\bar{\pi}\right)j\left(t\right)$$

• The unconditional expectation

$$\mathbb{E}\left[j\left(t+D^{-1}\right)\right] = c\left(1-\bar{\pi}\right) + \left(1-c\bar{\pi}\right)\mathbb{E}\left[j\left(t\right)\right]$$

• For an agent born at 0:

$$\mathbb{E}\left[j\left(t\right)\right] = \frac{1 - \bar{\pi}}{\bar{\pi}} \left[1 - (1 - c\bar{\pi})^{Dt}\right]$$

3

Learning in Cities

Earnings

• Linear skill premium

$$w_j = w_0 + \alpha j$$

Spatial equilibrium

$$\begin{split} \alpha \sum_{t=0}^{\infty} \left(\beta\delta\right)^{t} \mathbb{E}\left[j\left(t\right)\right] &= \frac{kN}{2\left(1-\beta\delta\right)} \\ \alpha\beta\delta \frac{1-\left(1-c\bar{\pi}\right)^{D}}{1-\beta\delta\left(1-c\bar{\pi}\right)^{D}} \frac{1-\bar{\pi}}{\bar{\pi}} &= \frac{kN}{2} \\ \alpha\beta\delta \frac{1-\left(2-\delta^{-\frac{1}{D}}\right)^{D}}{1-\beta\delta\left(2-\delta^{-\frac{1}{D}}\right)^{D}} \left(\frac{c}{\delta^{-\frac{1}{D}}-1}-1\right) &= \frac{kN}{2} \end{split}$$

- The comparative statics are identical to the case of binary skills
 - D'(N) must be sufficiently small for a stable equilibrium

3

A B M A B M

- ∢ ศ⊒ ▶

Human Capital and City Growth

- Cities with more educated residents have faster population growth
 - ▶ $+\sigma \approx 1\%$ share of college graduates $\Rightarrow +\sigma/4 \approx 0.5\%$ decadal growth
- **O** Consumer City: cities increasingly depend on consumption amenities
 - Educated neighbors are a consumption amenity
- Information City: cities exist to facilitate the flow of ideas
 - Educated workers specialize in ideas
- 8 Reinvention City: cities survive by adapting to new technologies
 - Educated people are the drivers of change
 - Demand-side theories: declining real wages are a necessary condition
 - Supply-side theories: rising nominal wages are a sufficient condition

Giacomo Ponzetto (CREI)

Identification

Controlling directly for multiple city characteristics

- Including climate amenities strengthens the effect
- The educated tend to live in colder, damper cities
- Including metropolitan-area fixed effects
 - Similar coefficients, less precisely estimated
 - Striking significance considering that education is hugely persistent
- Measuring education by the number of colleges per capita in 1940
 - Directly instead of IV because orthogonality is less than guaranteed
- Siming: do skilled people flock to fast-growing cities?
 - The unskilled move to declining cities with cheap housing
 - Little evidence of skill sorting among cities with positive growth

The Connection Between Skills and Growth

Productivity drives the connection between skills and growth

- Education level predicts future growth in housing.prices and https://www.housing.prices and https://wwwwwwwwwwwwwwwwwwwwwww
- Real wages are not declining and may be rising with skill Table
- 2 Effects on cities within metropolitan areas Table
 - > The prevalence of high-school dropouts predicts local decline
 - Evidence of consumption disamenities if the MSA is the labor market
- Iuman capital matters controlling for patents per capita
 - Skills spillovers seem to go beyond R&D spillovers
- Support for the reinvention hypothesis
 - Negative cross-effect of skills and warmth or immigration
 - Skilled cities shifted out of manufacturing more quickly

 Table

Wage regressions include year and MSA fixed effects, controls for age, age squared, education dummies interacted with year, race, Hispanic ethnicity, marital status, and veteran status. Observations include males over 21 years old with complete observations.

Value regressions include year and MSA fixed effects, controls for number of rooms and bedrooms, quality of plumbing and kitchen facilities, and age of the building. The results use a 50 percent random sample of the IPUMS data for all single units with the relevant information.
