

Supplementary Figures for “**Transitory Economic Shocks and Civil Conflict**”
by Antonio Ciccone available at www.antoniociccone.eu

Figure 1

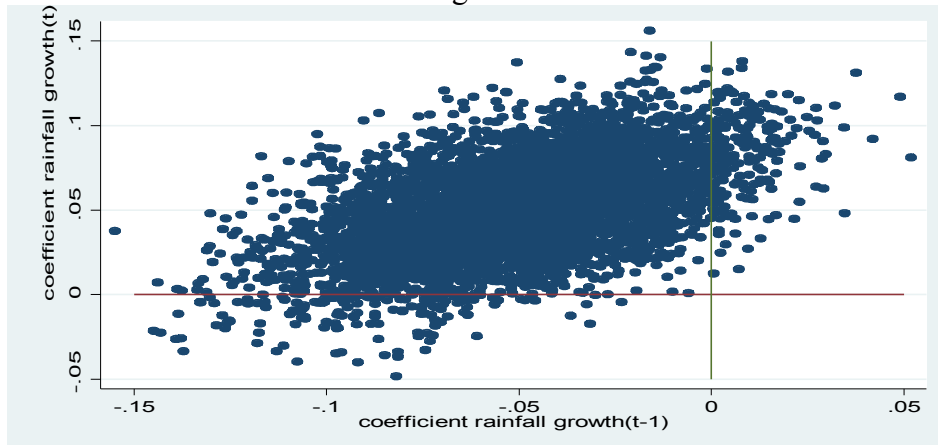

The figure contains the least-squares coefficients and standard errors for rainfall growth at t corresponding to the (5000) rainfall growth regressions with generated data described in Section 3 of “Transitory Economic Shocks and Civil Conflict” by Antonio Ciccone available at www.antoniociccone.eu. The points outside of the “V” are points where the t -statistic is greater than 2 in absolute value (the absolute value of the point estimate is more than twice the standard error). It can be seen that most point estimates are positive. 60% of the estimates come with an absolute t -statistic smaller than 2, while 40% have a t -statistic greater than 2.

Figure 2

The figure contains the least-squares coefficients and standard errors for rainfall growth at $t-1$ corresponding to the (5000) rainfall growth regressions with generated data described in Section 3 of “Transitory Economic Shocks and Civil Conflict” by Antonio Ciccone available at www.antonioiciccone.eu. The points outside of the “V” are points where the t -statistic is greater than 2 in absolute value (the absolute value of the point estimate is more than twice the standard error). It can be seen that most point estimates are negative. 59% of the estimates come with an absolute t -statistic smaller than 2, while 41% have a t -statistic smaller than -2.

Figure 3

The figure contains the least-squares coefficients for rainfall growth at t and $t-1$ corresponding to the (5000) rainfall growth regression with generated data described in Section 3 of “Transitory Economic Shocks and Civil Conflict” by Antonio Ciccone available at www.antonioiciccone.eu. It can be seen that most points correspond to a positive effect of rainfall growth at t and a negative effect of rainfall growth at $t-1$.
